

# Are All Plasma Pens The Same?

PLASMA WAS DEFIANTLY THE TREND TREATMENT OF 2018 AND IT LOOKS LIKE IT IS HERE TO STAY!

**T**his amazing treatment is one of the only treatments that actually shrinks excess skin. It is best known for the plasma eye lift non-surgical blepharoplasty. There is no doubt in my mind this is a great treatment offering results that can last for 3-5 years. Who wouldn't want rid of their wrinkles for half a decade it is like freezing the clock on aging? So why all the controversy in the media and online? We decided to ask leading aesthetic Dr Vincent Wong, Director of VinDoc Lab the Aesthetic Training and Product brand to look out for in 2019, who has been using plasma within his practice for over 5 years making him one of the UKs top plasma practitioners.

**SE:** So, Dr Wong, what are your thoughts on the love hate relationship with plasma within the aesthetic market currently?

**VW:** Plasma is amazing in the right hands and with the right device. The problems that we are seeing in the UK is that there are so many unregulated devices on the market. Even so-called reputable names within the industry are selling very poor-quality devices costing as little as £100 for up to £4,000 with little to no training. I feel sorry for the practitioners that have bought these devices as they have trusted big names within the beauty industry and are left out of pocket with a device that they are not suitably trained to use and that can do excessive damage to the skin causing long downtime and risks of pigmentation and scarring to the end clients.

**SE:** What Plasma Pen do you use and why?

**VW:** I use the Jett Plasma Pen the world's only Direct Current Plasma Pen. I saw this first at a show 5 years ago in Paris. I had seen other plasma pens, but the DC technology developed by the Jett Medical Plasma Pen team offered me far superior control. With Jett Plasmas DC Technology, I can control my dot size and more importantly the depth into the skin. The down time to my end clients is more than

half and the results are great. Some of the AC devices have tried to control the dot size by replacing their probes with acupuncture needles but all this has done is reduced the devices ability to reach the target depth leading to less surface damage but no longevity to the results. Jett Medical Plasma Pen are also the only company who offered accredited Level 4 training This was also, an important factor to me as I believe that good training is needed for any practitioner to be able to do this treatment well.

**SE:** So, do you think all plasma pens should be Direct Current Technology Like the Jett Plasma Pen? Would this be safer for clients?

**VW:** Jett hold the patent on the DC technology makes their Plasma Pen more controlled in depth and direction reducing the down time for the clients especially around the eye are. I believe if you own a good quality AC device with safety functions (medical grade) and you have the right training it can be safe enough, but it will always cause excessive down time if you want to achieve long lasting results due to the large dot size needed with this technology to gain the depth. That is just the physics behind the technology. I think most plasma pen companies would be DC if Jett had not patented the technology. DC is a more advanced version of the plasma pen offering clients better results will less down time and risk.

**SE:** What should clinics look for when buying a Plasma Pen?

**VW:** Safety, Visibility, Consistency, Stability, Precision, Down time

**SE:** Why Choose Jett Plasma?

**VW:** Jett Plasma is manufactured in the Czech Republic with its very own research and design centre. The brand sold in over 60 countries with over 1,600 doctors in Europe purchasing the Jett Plasma Pen in their practices last year alone. It is safer offering increased control with amazing results and less down time to your clients

*Dr Vincent Wong, Director at Jett Medical, is a General Medical Council (GMC) registered, Save Face accredited, multi-award winning advanced cosmetic doctor, who is passionate about facial aesthetics education and training. Experienced in training and lecturing at various aesthetics conferences internationally. As an innovator and creator of new techniques in facial aesthetics, Dr Vincent is also featured regularly in popular press including TV and radio channels. <http://jett-medical.co.uk>*
